

Facility Overview

Overview

The Warehouse Management Module Facility process is the highest level within a Warehouse. It provides the capability to define the capacity of a facility.

Facilities are primarily intended to be physical Real Property with the capability to associate it to a Real Property Unique Identifier (RPUID), allowing for the identification of the Installation, Site, etc. where the facility is located. While it is intended to be real property, Enterprise Logistics Management System (ELMS) will provide the capability for a Facility to be Non-Real Property, such as a Trailer or Military Van Container (MILVAN), which might be used to forward supply a Unit rather than the Unit coming to a physical location to obtain the required supplies and materiel. Inside the trailer, you could then identify Locations/Containers as they would with real property.

A Facility may or may not have Zones. Zones are intended to provide the capability to sub-divide a facility into smaller units. Zones must be established if the warehouse intends to utilize the Auto-Recommendation Location Store feature.

The Facility is the 5th tier within the warehouse tree and the first tier within what RPS UID is defining as the working level within the Warehouse application. The Logistics Program (1st tier), Region (2nd Tier), Site (3rd Tier), Warehouse (4th Tier), Location (below). There is no security at the Facility level. The access is managed at the Warehouse level.
